Another addendum for the (almost) matching 7-pin socket is available from [Conrad*](#)

item number: [740077*](#) - 62

If it takes about 10 minutes, it is not functionally different from the original distinguish.

Just out of curiosity. What exactly has to be modified on the socket?

Sincerely yours
Guido

Loosen the clips and remove the inner part, turning the inner part like this
that shows the indentation to the left from the front, then at the bottom
Mill a 2x1mm path (Dremel), finally some of the pegs at the back
remove so that the part can be inserted offset by 90 degrees. if
you want to cast epoxy on the left as shown in the picture above (is a
optical correction).

Hope that helps...

if someone finds the original, he should write it down briefly

Hello,

I think we have the same problem:

[Article "Which connector is the 7Pol Weller Station"](#)

I've already invested a few days of work and haven't found it,
then it works with the Amphenol after all, it is also available again from
binder at [conrad*](#) , see thread.

Where did you get the last pin from !? Bought 2 sockets? How did you have
it
manage that the pin holds reasonable?

Greeting,
Hannes

aaach no, you also have the 7th pole, I'll take the question with the 7th
pin back, then I'll already know that I have that with the
Plugs already made exactly the same ...

@ Snipers1
Thanks for the explanation.
